Conclusions

- Fusidic acid remains an excellent candidate for ABSSSI treatment, with 99.7% efficacy against staphylococcal species.
- Among the 31 fusidic acid-resistant S. aureus strains detected in 2008-2010, all strains had MIC values at 2->8 mg/L, indicating a potential systemic and topical therapy for ABSSSI and pneumonia.
- Continued fusidic acid clinical trials are warranted to further study the therapy's effectiveness.
